General

Product description

Multifix SE500 mortar is a 2-component reaction resin mortar based on a pure epoxy and will be delivered in a exclusive 2-C cartridge system. This high performance product may be used in combination with a hand-, battery-, or pneumatic tool and a static mixer. It was designed especially for the anchoring of threaded rods and reinforcing bars into concrete.

Properties and benefits

- > European Technical Assessment for bonded fasteners acc. to EAD 330499-01-0601 (Option 1): ETA-26/0189
- > European Technical Assessment for post-installed rebar acc. to EAD 330087-00-0601: ETA-26/0190
- > For heavy anchoring - doweling and post-installed rebar connection
- > Overhead application
- > Waterfilled bore holes
- > Suitable for attachment points with small edge- and axial distances due to an anchoring free of expansion forces
- > High chemical resistance
- > Low odour
- > High bending and pressure strength
- > Cartridge can be reused up to the end of the shelf life by replacing the static mixer or resealing cartridge with the sealing cap
- > State-of-the-art ingredients, complies with the latest REACH regulations, free off Phenol, (CAS# 108-95-2), DETA/TETA (CAS#111-40-0), Benzyl alcohols (CAS# 100-51-6), Bisphenol-A (CAS# 80-05-7)

Certifications

Application samples

Suitable for the fixation of facades, roofs, wood constructions, metal constructions; metal profiles, columns, beams, consoles, railings, sanitary devices, cable trays, piping, post-installed rebar connection (reconstruction or reinforcement), etc.

Handling and storage

- > Storage: store in a cold and dark place, storage temperature: from +5°C up to +35 °C
- > Shelf life: 24 months for cartridges (ST)

Applications and intended use

- > Base material: cracked and uncracked concrete, light-concrete, porous-concrete, solid masonry, hollow brick, natural stone (Attention! natural stone, can discolour; shall be checked in advance).
- > Anchor elements: Threaded rods (zinc plated or hot dip, stainless steel and high corrosion resistance steel), reinforcing bars, internal threaded rods, profiled rod, steel section with undercuts (e.g. perforated section)
- > Temperature range: Installation temperature +5°C up to +40°C;
Cartridge temperature min. +5°C; optimal +20°C;
Base material temperature after full curing -40°C to +72°C

Mortar properties

Properties	Test Method	Result
UV resistance	-	Pass
Watertightness	DIN EN 12390-8	0 mm
Temperature stability	-	≤ 80 °C
ph-value	-	> 12
Compressive strength	EN 196 Part 1	112 N / mm ²
Flexural strength	EN 196 Part 1	46.0 N / mm ²
Axial tensile strength	DIN EN ISO 527-2	24.3 N / mm ²
E modulus	DIN EN ISO 527-2	5,275 N / mm ²
Elongation at fracture	DIN EN ISO 527-2	1.1 %
Degree of shrinkage	DIN 52450	≤ 1.4 ‰
Hardness Shore A	DIN EN ISO 868	95.8
Hardness Shore D	DIN EN ISO 868	84.6
Density	-	≤ 1,50 kg / dm ³

Reactivity

Temperature of base material	Gelling- and working time	Full curing time in dry base material ¹⁾
+5 °C to +9 °C	80 min.	60 h
+10 °C to +14 °C	60 min.	48 h
+15 °C to +19 °C	40 min.	24 h
+20 °C to +24 °C	30 min.	12 h
+25 °C to +34 °C	12 min.	10 h
+35 °C to +39 °C	8 min.	7 h
+40 °C	8 min.	4 h
Cartridge temperature	+5 °C to +40 °C	+5 °C to +40 °C

1) The curing times in wet concrete has to be doubled.

Anchorage in concrete

Installation instruction

Drilling of the bore hole (HD, CD; HDB)

1a.

Hammer drilling (HD) or compressed air drilling (CD).

Drill a hole into the base material to the size and embedment depth required by the selected anchor (see page 9). Proceed with Step 2. In case of aborted drill hole, the drill hole shall be filled with mortar.

2a.

Hollow drill bit system (HDB)

Drill a hole into the base material to the size and embedment depth required by the selected anchor (see page 9). This drilling system removes the dust and cleans the bore hole during drilling (all conditions). Proceed with Step 3. In case of aborted drill hole, the drill hole shall be filled with mortar.

Attention! Standing water must be removed before cleaning.

MAC: Cleaning for dry and wet bore hole with diameter $d_0 \leq 20\text{mm}$ and bore hole depth $h_0 \leq 10d_{\text{nom}}$ (uncracked concrete only!)

2a.

Starting from the bottom or back of the bore hole, blow the hole clean with handpump (see page 8) a minimum of four times until return air stream is free of noticeable dust.

2b.

Check brush diameter (see page 9). Brush the hole with an appropriate sized wire brush $> d_{b,\text{min}}$ (see page 9) a minimum of four times in a twisting motion. If the bore hole ground is not reached with the brush, a brush extension must be used.

2c.

Finally blow the hole clean again with handpump (see page 8) a minimum of four times until return air stream is free of noticeable dust.

After cleaning, the bore hole has to be protected against re-contamination in an appropriate way, until dispensing the mortar in the bore hole. If necessary, the cleaning has to be repeated directly before dispensing the mortar. In-flowing water must not contaminate the bore hole again.

CAC: Cleaning for dry, wet and water-filled bore holes with all diameter in uncracked and cracked concrete

2a.

Starting from the bottom or back of the bore hole, blow the hole clean with compressed air (min. 6 bar) (see page 8) a minimum of two times until return air stream is free of noticeable dust. If the bore hole ground is not reached an extension must be used.

2b.

Check brush diameter (see page 8). Brush the hole with an appropriate sized wire brush $> d_{b, \text{min}}$ (see page 9) a minimum of two times in a twisting motion. If the bore hole ground is not reached with the brush, a brush extension must be used.

2c.

Finally blow the hole clean again with compressed air (min. 6 bar) (see page 8) a minimum of two times until return air stream is free of noticeable dust. If the bore hole ground is not reached an extension must be used.

3.

Attach a supplied static-mixing nozzle to the cartridge and load the cartridge into the correct dispensing tool. After every working interruption longer than the recommended working time (see page 4) as well as for new cartridges, a new static-mixer shall be used.

4.

Prior to inserting the anchor rod into the filled bore hole, the position of the embedment depth shall be marked on the anchor rods.

5.

Prior to dispensing into the anchor hole, squeeze out separately a minimum of three full strokes and discard non-uniformly mixed adhesive components until the mortar shows a consistent grey or red colour.

6.

Starting from the bottom resp. back of the cleaned anchor hole fill the hole up to approximately two-thirds with adhesive. Slowly withdraw of the static mixing nozzle as the hole is filled avoids creating air pockets. If the bore hole ground is not reached with the static-mixing nozzle, a appropriate extension must be used. Observe the gel-/ working times given (see page 4).

7.

Piston plugs shall be used acc. to table on page 9 for the following application:

> Horizontal assembly (horizontal direction) and ground erection (vertical downwards): Drill bit- $\varnothing d_0 \geq 18$ mm and embedment depth $h_{ef} > 250$ mm

> Overhead assembly (vertical upwards direction): Drill bit- $\varnothing d_0 \geq 18$ mm.

Assemble mixing nozzle, mixer extension and piston plug before injecting mortar.

8.

Insert piston plug to back of the hole and inject adhesive. If the bottom or back of the anchor hole is not reached, an appropriate extension nozzle must be used.
During injection the piston plug is naturally pushed out of the borehole by the back pressure of the mortar. Observe the gel-/working times given in the table on page 4.

9.

Push the fixing element into the anchor hole while turning slightly to ensure positive distribution of the adhesive until the embedment mark has reached the surface level.

The anchor should be free of dirt, grease, oil or other foreign material.

10.

After inserting the anchor, the annular gap between anchor rod and concrete, in case of a push through installation additionally also the fixture, must be complete filled with mortar. If excess mortar is not visible at the top of the hole, the requirement is not fulfilled and the application has to be renewed.

11.

For overhead application the anchor rod shall be fixed (e.g. wedges) until the mortar has started to harden.

12.

Allow the adhesive to cure to the specified time prior to applying any load or torque. Do not move or load the anchor until it is fully cured (see page 4).

13.

After full curing, the add-on part can be installed with up to the max. torque (see page 9) by using a calibrated torque wrench. It can be optional filled the annular gap between anchor and fixture with mortar. Therefore substitute the washer by the filling washer and connect the mixer reduction nozzle to the tip of the mixer. The annular gap is filled with mortar, when mortar oozes out of the washer.

Installation accessories

MAC - Hand pump (volume 750 ml)

Drill bit diameter (d_0): up to 20 mm

Drill hole depth (h_0): $< 10 d_{nom}$

Uncracked concrete only

CAC - Rec. compressed air tool (min 6 bar)

Drill bit diameter (d_0): all diameters

Brush RBT and brush extension

HDB – Hollow drill bit system

Drill bit diameter (d_0): all diameters

The hollow drill bit system contains the Heller Duster Expert hollow drill bit and a class M vacuum with minimum negative pressure of 253 hPa and flow rate of minimum 150 m³/h (42 l/s).

¹⁾ Both nominal drill hole diameters d_0 can be used.

Recommended loads

Threaded rod

The recommended loads are only valid for single anchors for a basic design, if the following conditions are valid:

$$c \geq 1.5 \times h_{ef} \mid s \geq 3.0 \times h_{ef} \mid h \geq 2 \times h_{ef}$$

$\Psi_{SUS} = 1.0$; percentage of dead load $\leq \Psi_{SUS}^0$ see table below

The recommended loads have been calculated using the partial safety factors for resistances stated in the ETA and with a partial safety factor for actions of $\gamma_f = 1.4$.

The partial safety factor for seismic action is $\gamma_1 = 1.0$.

If the conditions are not fulfilled the loads must be calculated acc. to EN 1992-4.

For further details observe ETA-26/0189.

Post-installed rebar

Installation instruction

A) Bore hole drilling

Note: Before drilling, remove carbonated concrete and clean contact areas. in case of aborted drill hole: the drill hole shall be filled with mortar.

1a.

Hammer (HD) or compressed air drilling (CD).

Drill a hole into the base material to the size and embedment depth required by the selected reinforcing bar. Proceed with Step B1.

1b.

Hollow drill bit system (HDB)

Drill a hole into the base material to the size and embedment depth required by the selected reinforcing bar. This drill system removes the dust and cleans the bore hole during drilling. Proceed with Step C.

1c.

Diamond drilling (DD).

Drill with diamond drill a hole into the base material to the size and embedment depth required by the selected anchor. Proceed with Step B2.

Attention! Standing water must be removed before cleaning.

B1) Bore hole cleaning

MAC: Cleaning for dry and wet bore hole with diameter $d_0 \leq 20\text{mm}$ and bore hole depth $h_0 \leq 10d_{\text{nom}}$ with drilling method HD/CD

2a.

Starting from the bottom or back of the bore hole, blow the hole clean with handpump (see page 15) a minimum of four times until return air stream is free of noticeable dust.

2b.

Check brush diameter (see page 16 - 17). Brush the hole with an appropriate sized wire brush $> d_{b,\text{min}}$ (see page 15) a minimum of four times in a twisting motion. If the bore hole ground is not reached with the brush, a brush extension must be used.

2c.

Finally blow the hole clean again with handpump (see page 15) a minimum of four times until return air stream is free of noticeable dust.

After cleaning, the bore hole has to be protected against re-contamination in an appropriate way, until dispensing the mortar in the bore hole. If necessary, the cleaning has to be repeated directly before dispensing the mortar. In-flowing water must not contaminate the bore hole again.

CAC: Cleaning for all bore hole diameter and bore hole depth with drilling method DD

2a.

Starting from the bottom or back of the bore hole, blow the hole clean with compressed air (min. 6 bar) (see page 15) a minimum of two times until return air stream is free of noticeable dust. If the bore hole ground is not reached an extension shall be used.

2b.

Check the brush diameter (see page 16 - 17). Brush the hole with an appropriate sized wire brush $> d_{b,min}$ (see page 16 - 17) a minimum of two times. If the borehole ground is not reached with the brush, a brush extension shall be used.

2c.

Finally blow the hole clean again with compressed air (min. 6 bar) (see page 15) a minimum of two times until return air stream is free of noticeable dust. If the bore hole ground is not reached an extension shall be used.

After cleaning, the bore hole has to be protected against re-contamination in an appropriate way, until dispensing the mortar in the bore hole. If necessary, the cleaning has to be repeated directly before dispensing the mortar. In-flowing water must not contaminate the bore hole again.

B2) Bore hole cleaning

SPCAC: Cleaning for all bore hole diameter and bore hole depth with drilling method DD with drilling method DD

2a.

Rinsing with water until clear water comes out.

2b.

Check the brush diameter (see page 16 - 17). Brush the hole with an appropriate sized wire brush $> d_{b,min}$ (see page 16 - 17) a minimum of two times. If the borehole ground is not reached with the brush, a brush extension shall be used.

2c.

Rinsing again with water until clear water comes out.

Attention! Standing water in the bore hole must be removed before cleaning.

**2d.**

Starting from the bottom or back of the bore hole, blow the hole clean with compressed air (min. 6 bar) (see page 16) a minimum of two times until return air stream is free of noticable dust. If the bore hole ground is not reached an extension shall be used

**2e.**

Check the brush diameter (see page 18 - 19). Brush the hole with an appropriate sized wire brush $> d_{b,min}$ (see page 18 - 19) a minimum of two times. If the borehole ground is not reached with the brush, a brush extension shall be used.

**2f.**

Finally blow the hole clean again with compressed air (min. 6 bar) (see page 16) a minimum of two times until return air stream is free of noticable dust. If the bore hole ground is not reached an extension shall be used.

After cleaning, the bore hole has to be protected against re-contamination in an appropriate way, until dispensing the mortar in the bore hole. If necessary, the cleaning has to be repeated directly before dispensing the mortar. In-flowing water must not contaminate the bore hole again.

Cleaning and installation tools

Rec. compressed air tool hand slide valve (min 6 bar)

Brush RBT and brush extension

Hand pump (volume 750 ml)

SDS Plus Adapter

HDB - Hollow drill bit

C) Preparation of bar and cartridge**3a.**

Attach the static mixer tightly onto the cartridge and insert the cartridge into a suitable dispensing tool. For every working interruption longer than the recommended working time (see page 4) as well as for new cartridges, a new static-mixer shall be used.

**3b.**

In case of using the mixer extension VL16/1,8 the tip on the mixer nozzle has to be cut off at position „X“.

**4.**

Prior to inserting the reinforcing bar into the filled bore hole, the position of the embedment depth shall be marked (e.g. with tape) on the reinforcing bar and insert bar in empty hole to verify hole and depth l_v (see page 18). The bar should be free of dirt, grease, oil or other foreign material.

**5.**

Prior to dispensing into the anchor hole, squeeze out separately the mortar until it shows a consistent grey or red colour, but a minimum of three full strokes and discard non-uniformly mixed adhesive components.

D) Filling the bore hole

Injection tool must be marked by mortar level mark l_m and anchorage depth l_v resp. $l_{e.ges}$ with tape or marker.

Quick estimation: $l_m = 1/3 * l_v$

Continue injection until mortar level mark l_m becomes visible.

Optimum mortar volume: $l_m = l_v \text{ rep. } l_{e.ges} * (1.2 * \phi^2/d_0^2 * 0.2) \text{ [mm]}$

6a.

Starting from the bottom or back of the cleaned bore hole fill the hole with adhesive, until the level mark at the mixer extension (see below) is visible at the top of the hole. If the bottom or back of the hole is not reached, an appropriate extension nozzle must be used.

Slowly withdraw the static mixing nozzle and using a piston plugs during injection of the mortar, helps to avoid creating air pockets. Observe the gel-/working times given on page 4.

6b.

Piston plugs shall be used according to table on page 18 - 19 for the following application:

For overhead and horizontal installation.

In vertical downwards direction with bore holes deeper than 240 mm.

Assemble mixing nozzle, mixer extension and piston plug before injecting mortar.

6c.

Insert piston plug to back of the hole and inject adhesive. If the bottom or back of the anchor hole is not reached, an appropriate extension nozzle must be used. During injection the piston plug will be naturally extruded out of the drill hole by the adhesive pressure. Observe gel-/ working times given on page 4.

E) Inserting the rebar**7.**

Push the reinforcing bar into the anchor hole while turning slightly to ensure positive distribution of the adhesive until the embedment depth is reached.
The bar should be free of dirt, grease, oil or other foreign material.

**8a.**

Be sure that the bar is inserted in the bore hole until the embedment mark is at the concrete surface and that excess mortar is visible at the top of the hole. If these requirements are not maintained, the application has to be renewed. For overhead application the anchor rod shall be fixed (e.g. wedges).

**8b.**

For horizontal and overhead installation fix embedded part (e. g. with wedges) until the mortar has started to harden.

**9.**

Observe gelling time t_{gel} . Attend that the gelling time can vary according to the base material temperature (see page 4). It is not allowed to move the bar after gelling time t_{gel} has elapsed. Allow the adhesive to cure to the specified time prior to applying any load. Do not move or load the bar until it is fully cured (attend table on page 4). After full curing time t_{cure} has elapsed, the add-on part can be installed.

Design anchorage and lap length

The calculation of the design anchoring lengths of reinforcing bars, if used as end anchoring or as overlapping joint, has to consider the details and provisions of the approval ETA-26/0190 and the EN 1992-1-1:2004+AC:2010.

The design load with corresponding failure mode („pull-out failure“ or „steel failure“) were determined for selected rebar diameters and anchorage lengths. The results for end anchoring and overlapping joints are given in the tables below.

The calculations are based on following assumptions:

- > Rebar BSt 500 S. $f_{yk} = 500 \text{ N/mm}^2$. Material safety factor of $\gamma_s = 1.15$
- > Concrete class C20/25 and „good bond conditions“ acc. EN 1992-1-1:2004+AC:2010 considered.
Rebar diameters $\leq d = 32 \text{ mm}$.
- > The bond properties of the bars is considered by the coefficients:
 - $a_1 = 1.0$; is for the effect of the form of the bars assuming adequate cover;
1.0 for straight rebars
 - $a_2 = 1.0$; is for the effect of concrete minimum cover; has to be checked
 - $a_3 = 1.0$; is for the effect of confinement by transverse reinforcement;
1.0 for no transverse reinforcement
 - $a_4 = 1.0$; is for the influence of one or more welded transverse bars;
1.0 for no welded transverse reinforcement
 - $a_5 = 1.0$; is for the effect of the pressure transverse;
1.0 if no transverse pressure is assumed
 - $a_6 = 1.5$; is for the percentage of lapped bars relative to the total cross section area.
1.5 due to the given situation on the construction side

All drilling methods hammer drilling (HD), compressed air drilling (CD), Hollow drill bit (HDB), Diamond drilling (DD) are considered by the amplification factor of $a_{ib} = 1.0$

End anchoring of slabs or beams (e.g. designed as simply supported)

¹⁾ Mortar volume of the overlap joint. The mortar volume of the concrete cover c_r , at the face of the existing reinforcing steel, was not taken into account.

²⁾ $l_{v,max}$ is limited to 1000 mm, see ETA-26/0190

The specified design load N_{Rd} (End anchoring, Overlapping joints) can be converted to further concrete classes, while maintaining the previously accepted boundary conditions and anchorage lengths l_{bd} or lap length l_o , with the approach as follows:

$$N_{Rd,con} = \min(N_{Rd,s}; N_{Rd} \cdot f_{bd,con} - \text{Factor} \cdot k_b - \text{Factor}) \text{ [kN]}$$

The conversion factor $f_{bd,con}$, with the corresponding reduction factor k_b , can be taken from the following table depending on the drilling method, the concrete class and the diameter of the rebar:

Hammer drilling (HD), compressed air drilling (CD), hollow drill bit system (HDB)

Fire resistance - Overlapping joints

The present tables are supplying the mean reduction factor $\bar{k}_{\Theta(x)}$, needed for determining the design bond strength $f_{bd,fi}$ of post-installed rebar connections under fire exposure in a fire-resistance grating.

The specified mean reduction factor $\bar{k}_{\Theta(x)}$ is valid for slab to slab connections (overlapping joints), where the lower surface is exposed perpendicular to fire (one side), the temperature is uniform. Therefore the bond resistance is uniform along the bond also and depends on the concrete cover and the duration of the fire.

The heat development of structural members is calculated by a fire model, based on the standard uniform-temperature-time-curve (UTTC) acc. to ISO 834-1 and tries to simulate a real fire.

Below the calculated heat distribution of a slab after a temperature impact of 14400 sec. (240 min) for the fire-resistance grade R240.

The effect of heat on the bond strength of the mortar was determined by tests and is expressed by the reduction factor $\bar{k}_{b,fi}(\Theta)$ given in the ETA-26/0190.

The calculation of the required design lap length l_0 shall be carried out in accordance with EN 1992-1-1:2004+AC:2010, section 8.7.3 and the provisions of the ETA-26/0190 shall be met.

The design value of the bond strength $f_{bd,fi}$ under fire exposure has to be calculated by the following equation:

$$f_{bd,fi} = \bar{k}_{\Theta(x)} * f_{bd,PIR} * \gamma_c / \gamma_{M,fi} * f_{bd,fi,con} \leq f_{bd,PIR}$$

with:

$f_{bd,fi}$ = Design value of the bond strength under fire exposure in N/mm²

$\bar{k}_{\Theta(x)}$ = Mean reduction factor under fire exposure as a function of the temperature profile. given in the tables below

$f_{bd,PIR}$ = Design value of the bond strength in cold condition acc. ETA-26/0190, tab. C2 depending on concrete class, rebar diameter, drilling method and bonding range acc. EN 1992-1-1 in N/mm²

γ_c = Partial safety factor of concrete acc. EN 1992-1-1;
1.5 in absence of national regulation

$\gamma_{M,fi}$ = Partial safety factor of fire exposure acc. EN 1992-1-2;
1.0 in absence of national regulation

$f_{bd,fi,con}$ = Conversion factor taking into account the influence of the concrete class

The mean reduction factor $\bar{k}_{\Theta(x)}$ for slab to slab connections with rebar Ø8 - Ø32 mm and fire at 30, 60, 90, 120, 180 or 240 min is given for a concrete cover c_{nom} in the present table and valid for good bond conditions only:

¹⁾ c_{nom} = concrete cover.

²⁾ $\bar{k}_{\Theta(x)}$ = Mean reduction factor over the embedment depth of the rebar as a function of the temperature profile.

Intermediate values of $\bar{k}_{\Theta(x)}$ may be interpolated linearly. Extrapolation is not permitted.

The bond strength $f_{bd,PIR}$ depends on the concrete class and rebar diameter as well as the corresponding conversion factor $f_{bd,fi,con}$ and can be found in the following table:

Hammer drilling (HD), compressed air drilling (CD), hollow drill bit system (HDB)

The given values do not deal with the mechanical design at ambient temperature, these shall be done in addition and related to ETA-26/0190.

Post-installed rebar connections shall be designed in ambient temperature conditions before being designed in fire conditions. The partial safety factor for actions can be assumed to be $\gamma_F = 1.0$ for determining recommended loads.

Beam to wall connection (anchoring)

The present table is supplying the mean reduction factor $\bar{k}_{\Theta(x)}$, needed for determining the design bond strength $f_{bd,fi}$ of post-installed rebar connections under fire exposure in a fire-resistance rating.

The mean reduction factor $\bar{k}_{\Theta(x)}$ is valid for beam to wall or column to slab connections, where the rebar is bonded inside the wall or slab, there is a temperature gradient in the thickness of the wall respectively slab if the beam (three sides) or column is exposed to fire (three sides).

The temperature along the bonding interface is not uniform and depends on the fire duration, the anchoring length and the concrete cover of the rebar inside the beam (which acts as a protection against thermal exposure). Therefore, the temperature profiles along the bond are determined for each fire duration, for each bonded length and for the concrete covers inside the beam of $c_{nom} = 10, 20, 30$ and 40 mm .

The given mean reduction factor $\bar{k}_{\Theta(x)}$ is a mean value as a function of the temperature profile along the bonding length.

The calculated model of the fire is based on the standard uniform-temperature-time-curve (UTTC) acc. to ISO 834-1 and tries to simulate the heat development of structural members at a real fire.

Below the calculated heat distribution of a beam / column and wall / foundation after a temperature impact of 14400 sec. (240min) for the fire-resistance grade R240.

The fire model determines the heat distribution for rebars at the component corner (2 sides flamed) and at the component edge (1 side flamed).

The effect of heat on the bond strength of the mortar was determined by tests and is expressed by the reduction factor $k_{b,fi}(\Theta)$ given in the ETA-26/0190.

The calculation of the required design lap length l_0 shall be carried out in accordance with EN1992-1-1:2004+AC:2010, section 8.7.3 and the provisions of the ETA-26/0190 shall be met.

The design value of the bond strength $f_{bd,fi}$ under fi re exposure has to be calculated by the following equation:

$$f_{bd,fi} = \bar{k}_{\Theta(x)} * f_{bd,PIR} * \gamma_c / \gamma_{M,fi} * f_{bd,fi,con} \leq f_{bd,PIR}$$

with:

$$f_{bd,fi} = \text{Design value of the bond strength under } fi \text{ re exposure in N/mm}^2$$

$$\bar{k}_{\Theta(x)} = \text{Mean reduction factor under } fi \text{ re exposure as a function of the temperature profile, given in the tables below}$$

$$f_{bd,PIR} = \text{Design value of the bond strength in cold condition acc. ETA-26/0190, tab. C2 depending on concrete class, rebar diameter, drilling method and bonding range acc. EN 1992-1-1 in N/mm}^2$$

$$\gamma_c = \text{Partial safety factor of concrete acc. EN 1992-1-1; 1,5 in absence of national regulation}$$

$$\gamma_{M,fi} = \text{Partial safety factor of } fi \text{ re exposure acc. EN 1992-1-2; 1,0 in absence of national regulation}$$

$$f_{bd,fi,con} = \text{Conversion factor taking into account the influence of the concrete class}$$

The mean reduction factor $\bar{k}_{\Theta(x)}$ for e.g. beam on wall or column on slab applications for concrete covers of $c_{nom} = 10, 20, 30$ and 40 mm with the corresponding diameter of the rebar and fire-resistance grading at 30, 60, 90, 120, 180 or 240 min is given for a rebar at the edge (1 side flamed) or at the corner (2 sides flamed) in the following tables and valid for good bond conditions:

¹⁾ c_{nom} = concrete cover

²⁾ l_v = embedment length of the bar in the concrete

³⁾ $\bar{k}_{\theta(x)}$ = Mean reduction factor over the embedment depth of the rebar as a function of the temperature profile

Intermediate values of $\bar{k}_{\theta(x)}$ may be interpolated linearly. Extrapolation is not permitted.

The recommended load capacity $f_{bd,PIR}$ depends on the drilling method, the concrete class and the reinforcement diameter with the corresponding conversion factor $f_{bd,fi,con}$. The values can be taken from the following tables for reinforcement bars at the component corner (2-sided flaming) and at the component edge (1-sided flaming):

Hammer drilling (HD), compressed air drilling (CD), hollow drill bit system (HDB)			
Concrete class	Rebar-Ø	$f_{bd,PIR}$ -Factor	$f_{bd,fi,con}$ -Factor
[-]	[mm]	[N/mm²]	[-]

The given values does not deal with the mechanical design at ambient temperature, these shall be done in addition and related to ETA-26/0190.

Post-installed rebar connections shall be designed in ambient temperature conditions before being designed in fire conditions.

The bond resistance $f_{bd,fi}$ shall not be applied for beam to beam connections.

The partial safety factor for actions can be assumed to be $\gamma_F = 1.0$ for determining recommended loads.
